

AMENDMENTS TO THE CLAIMS:

Claim 1. (Currently amended) A task system, comprising:

a storage for storing one or more event identifiers for an event of a plurality of events;

a task control device for creating a task based on said event; and

a task processing device for executing a plurality of tasks,

whereupon completing a first task of said plurality of tasks, said task processing device initiates a search for another event identifier, and if said another event identifier is the same as said one or more event identifiers corresponding to said first task, then processes a second task, which has an event identifier that is the same as said first task, using a resource used by said first task.

Claim 2. (Currently amended) The task processing system according to Claim 1, wherein a first resource used by said first task, which is completed, is released from said task processing device toward said storage, when said another event identifier is not the same as said one or more event identifiers corresponding to said first task.

Claim 3. (Previously presented) The task processing system according to Claim 2, wherein said first resource is released from said storage, when said first resource is transferred from said storage via said task control device to said task processing device.

Claim 4. (Previously presented) The task processing system according to Claim 1, wherein:

said storage stores said one or more event identifiers corresponding to said first task

identifier, which is executed by said task processing device, and

said task control device executes a search for said one or more event identifiers corresponding to said first task in order to create said second task, which is the same as said first task, and executes said second task after completing said first task.

Claim 5. (Previously presented) The task processing system according to Claim 1, whereupon completing said first task, said processing device deletes one of said one or more event identifiers corresponding to said first task from said storage.

Claim 6. (Previously presented) The task processing system according to Claim 1, wherein said storage includes a task resource storing unit.

Claim 7. (Previously presented) The task processing system according to Claim 1, wherein said task control device includes an event checker that identifies said one or more event identifiers for each task of said plurality of tasks.

Claim 8. (Previously presented) The task processing system according to Claim 1, wherein said task control device includes a task creator that creates a task corresponding to one of said one or more event identifiers.

Claim 9. (Previously presented) The task processing system according to Claim 1, wherein said task control device includes a task resource manager that transfers a task resource, corresponding to said one of said one or more event identifiers, to said task

processing unit.

Claim 10. (Currently amended) A task system, comprising:

a storage for storing one or more event identifiers for each task of a plurality of tasks;

and

a task processing device for executing a plurality of tasks,

whereupon completing a first task of said plurality of tasks, said task processing device initiates a search for another event identifier, and if said another event identifier is the same as said one or more event identifiers corresponding to said first task, then processes a second task, which has an event identifier that is the same as said first task, using a resource used by said first task.

Claim 11. (Previously amended) The task system according to claim 10, whereupon completing a first task of said plurality of tasks, said task processing device deletes one of said one or more event identifiers corresponding to said first task from said storage.

Claim 12. (Previously amended) The task system according to claim 10, wherein said storage stores a plurality of task resources corresponding to said plurality of tasks.

Claim 13. (Previously amended) The task system according to claim 10, further comprising:

a task control device, including:

an event checker that identifies said one or more event identifiers for each task

of said plurality of tasks;

a task creator that creates a task corresponding to an identified event identifier;

and

a task resource manager that transfers a task resource, corresponding to said task, to said task processing unit

Claim 14. (Previously presented) A method of processing a task, comprising:

processing a first task with a first task resource;

deleting a first event identifier, corresponding to said first task from an event storing unit, upon completion of said processing; and

processing a second task with said first task resource, if a second event identifier, stored in said event storing unit, is the same as said first event identifier.

Claim 15. (Previously presented) The method according to Claim 14, further comprising:

writing a second task resource into a processing unit, if said second event identifier is not the same as said first event identifier.

Claim 16. (Previously presented) A method of processing a task according to Claim 14, further comprising:

initially storing a first event and said first event identifier in said event storing unit;

and

creating said first task corresponding to said first event.
